THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO THE PUBLIC AFTER ISSUES ARE RESOLVED.

## Introduction

EtherAuthority was contracted by the FatCats team to perform the Security audit of the FatCats NFT smart contract code. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on May 28th, 2022.

## The purpose of this audit was to address the following:

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

## **Project Background**

- FatCats Contract is an NFT token contract having minting in steps step1, step2 and public mint. Minting steps set by the owner. Whitelisted users can mint NFT in step1 and step2. Whitelisted users are validated by markleproof.
- FatCats contract inherits the MerkleProof, Ownable, Address, VRFCoordinatorV2Interface, VRFConsumerBaseV2, IERC721Receiver, Context, IERC721Metadata, Strings, ERC165, IERC721, standard smart contracts from the OpenZeppelin library.
- These OpenZeppelin contracts are considered community-audited and time-tested, and hence are not part of the audit scope.

# **Audit scope**

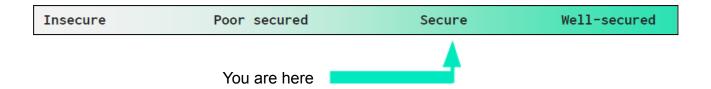

Name	Code Review and Security Analysis Report for FatCats NFT Smart Contract	
Platform	Ethereum / Solidity	
File	FatCats.sol	
File MD5 Hash	744F2C27AEC36A03D1FC70F14486772F	
Online Code Link	0xedF6d3C3664606Fe9EE3a9796d5CC75E3B16e682	
Audit Date	May 28th, 2022	

# **Claimed Smart Contract Features**

Claimed Feature Detail	Our Observation	
Tokenomics:	YES, This is valid.	
Name: FatCats		
Symbol: FCD		
Maximum Supply: 5000	YES, This is valid.	
Price: 0.08 ether		
<ul> <li>Maximum NFT By Wallet1: 2</li> </ul>		
<ul> <li>Maximum NFT By Wallet2: 10</li> </ul>		
Callback Gas Limit: 100,000		
Request Confirmations: 3		
Randomness requested from:		
Chainlink VRF Coordinator		

## **Audit Summary**

According to the standard audit assessment, Customer's solidity based smart contracts are "Secured". This token contract does contain owner control, which does not make it fully decentralized.

We used various tools like Slither, Solhint and Remix IDE. At the same time this finding is based on critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit overview section. General overview is presented in AS-IS section and all identified issues can be found in the Audit overview section.

We found 0 critical, 0 high, 0 medium and 1 low and some very low level issues.

**Investors Advice:** Technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

# **Technical Quick Stats**

Main Category	Subcategory	Result
Contract	Solidity version not specified	Passed
Programming	Solidity version too old	Passed
	Integer overflow/underflow	Passed
	Function input parameters lack of check	Passed
	Function input parameters check bypass	Passed
	Function access control lacks management	Passed
	Critical operation lacks event log	Moderated
	Human/contract checks bypass	Passed
	Random number generation/use vulnerability	N/A
	Fallback function misuse	Passed
	Race condition	Passed
	Logical vulnerability	Passed
	Features claimed	Passed
	Other programming issues	Passed
Code	Function visibility not explicitly declared	Passed
Specification	Var. storage location not explicitly declared	Passed
	Use keywords/functions to be deprecated	Passed
	Unused code	Passed
Gas Optimization	"Out of Gas" Issue	Passed
	High consumption 'for/while' loop	Passed
	High consumption 'storage' storage	Passed
	Assert() misuse	Passed
Business Risk	The maximum limit for mintage not set	Passed
	"Short Address" Attack	Passed
	"Double Spend" Attack	Passed

**Overall Audit Result: PASSED** 

**Code Quality** 

This audit scope has 1 smart contract. Smart contract contains Libraries, Smart contracts,

inherits and Interfaces. This is a compact and well written smart contract.

The libraries in FatCats Token are part of its logical algorithm. A library is a different type of

smart contract that contains reusable code. Once deployed on the blockchain (only once),

it is assigned a specific address and its properties / methods can be reused many times by

other contracts in the FatCats Token.

The FatCats Token team has not provided scenario and unit test scripts, which would

have helped to determine the integrity of the code in an automated way.

Code parts are well commented on in the smart contracts. Ethereum's NatSpec

commenting style is recommended.

**Documentation** 

We were given a FatCats Token smart contract code in the form of an Etherscan web link.

The hash of that code is mentioned above in the table.

As mentioned above, code parts are **well** commented. So it is easy to quickly understand

the programming flow as well as complex code logic. Comments are very helpful in

understanding the overall architecture of the protocol.

**Use of Dependencies** 

As per our observation, the libraries are used in this smart contract infrastructure that are

based on well known industry standard open source projects.

Apart from libraries, its functions are used in external smart contract calls.

# **AS-IS** overview

## **Functions**

SI.	Functions	Type	Observation	Conclusion
1	constructor	write	Passed	No Issue
2	startTokenId	internal	Passed	No Issue

68	requestRandomWords	external	access only Owner	No Issue
69	fulfillRandomWords	internal	Passed	No Issue

# **Severity Definitions**

Risk Level	Description
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc.
High	High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial
Medium	Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose
Low	Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution
Lowest / Code Style / Best Practice	Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored.

# **Audit Findings**

## **Critical Severity**

No Critical severity vulnerabilities were found.

## **High Severity**

No High severity vulnerabilities were found.

## Medium

No Medium severity vulnerabilities were found.

#### Low

(1) Missing events:

It is recommended to emit appropriate events where significant state is being changed. This helps UI clients to interact with the blockchain. We suggest emitting events in following functions:

- updateMerleRoot
- setStep2
- setPublicStep
- updateMaxByWallet1
- updateMaxByWallet2
- setNewPrice
- revealNFT
- switchPause

- openPublicBurn
- updateMaxSupply
- withdraw
- setBaseURI
- setHidden
- setProxyAddress
- requestRandomWords

Status: Acknowledged

## Very Low / Informational / Best practices:

(1) Make variables constant:

```
address vrfCoordinator = 0x271682DEB8C4E0901D1a1550aD2e64D568E69909;
```

```
uint32 callbackGasLimit = 100000;
uint16 requestConfirmations = 3;
uint32 numWords = 1;
```

These variables will be unchanged. So, please make it constant. It will save some gas.

**Resolution:** Declare those variables as constant. Just put a constant keyword.

(2) No need for empty/default value assignment:

```
// Step 2 flag
bool public step_2 = false;
// Public Step flag
bool public publicStep = false;
// Reveal flag
bool public revealed = false;
// publicBurn flag
bool public publicBurnFlag = false;
```

```
// Shuffle flag
bool public shuffle = false;
```

Boolean variables are set by default as "false". So, no need to explicitly assign the value. Although this does not raise any security or logical vulnerability, it is a good practice to avoid setting empty/default values explicitly.

## Centralization

This smart contract has some functions which can be executed by the Admin (Owner) only. If the admin wallet private key would be compromised, then it would create trouble. Following are Admin functions:

- updateMerleRoot: owner can update merle root value.
- setStep2: Owner can set step2 status true.
- setPublicStep: Owner can set public step status true.
- updateMaxByWallet1: Owner can update maximum wallet1 value.
- updateMaxByWallet2: Owner can update maximum wallet2 value.
- setNewPrice: Owner can set a new price.
- revealNFT: Owner can set reveal NFT status true.
- switchPause: Owner can switch pause.
- openPublicBurn: Owner can open public burn flag.
- updateMaxSupply: Owner can update maximum supply value.
- giveAway: Owner can give away address and amount.
- withdraw: Owner can withdraw the token.
- burn: Owner can burn the amount.
- setBaseURI: Owner can set base URI.
- setHidden: Owner can set hidden string.
- setProxyAddress: Owner can set proxy address.
- isApprovedForAll: Owner can check is approval for all.
- requestRandomWords: Owner can request random words.
- publicMint: Admin user can mint amount.

To make the smart contract 100% decentralized, we suggest renouncing ownership in the smart contract once its function is completed.

Conclusion

We were given a contract code form of an Etherscan web link. And we have used all

possible tests based on given objects as files. We have not observed any major issues.

So, it's good to go for the production.

Since possible test cases can be unlimited for such smart contracts protocol, we provide

no such guarantee of future outcomes. We have used all the latest static tools and manual

observations to cover maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static

analysis tools. Smart Contract's high-level description of functionality was presented in the

As-is overview section of the report.

Audit report contains all found security vulnerabilities and other issues in the reviewed

code.

Security state of the reviewed smart contract, based on standard audit procedure scope, is

"Secured".

**Our Methodology** 

We like to work with a transparent process and make our reviews a collaborative effort.

The goals of our security audits are to improve the quality of systems we review and aim

for sufficient remediation to help protect users. The following is the methodology we use in

our security audit process.

Manual Code Review:

In manually reviewing all of the code, we look for any potential issues with code logic, error

handling, protocol and header parsing, cryptographic errors, and random number

generators. We also watch for areas where more defensive programming could reduce the

risk of future mistakes and speed up future audits. Although our primary focus is on the

in-scope code, we examine dependency code and behavior when it is relevant to a

particular line of investigation.

**Vulnerability Analysis:** 

Our audit techniques included manual code analysis, user interface interaction, and

whitebox penetration testing. We look at the project's web site to get a high level

understanding of what functionality the software under review provides. We then meet with

the developers to gain an appreciation of their vision of the software. We install and use

the relevant software, exploring the user interactions and roles. While we do this, we

brainstorm threat models and attack surfaces. We read design documentation, review

other audit results, search for similar projects, examine source code dependencies, skim

open issue tickets, and generally investigate details other than the implementation.

## **Documenting Results:**

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this we analyze the feasibility of an attack in a live system.

## Suggested Solutions:

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

## **Disclaimers**

## **EtherAuthority.io Disclaimer**

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

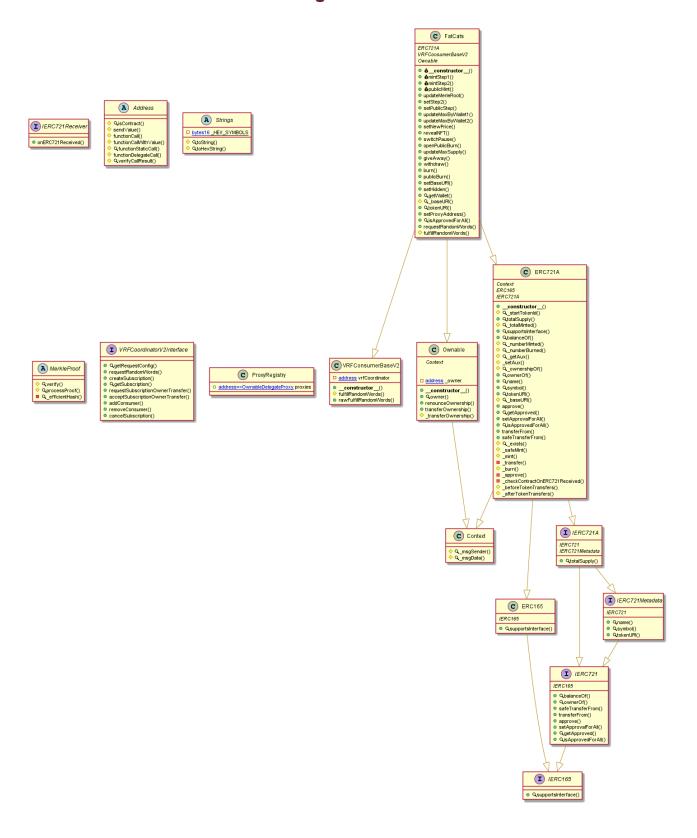

Due to the fact that the total number of test cases are unlimited, the audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

## **Technical Disclaimer**

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee explicit security of the audited smart contracts.

## **Solidity Static Analysis**

#### FatCats.sol

## Security

## Transaction origin:

Use of tx.origin: "tx.origin" is useful only in very exceptional cases. If you use it for authentication, you usually want to replace it by "msg.sender", because otherwise any contract you call can act on your behalf.

<u>more</u>

Pos: 815:16:

#### Check-effects-interaction:

Potential violation of Checks-Effects-Interaction pattern in FatCats.requestRandomWords(): Could potentially lead to re-entrancy vulnerability. Note: Modifiers are currently not considered by this static analysis.

<u>more</u>

Pos: 1032:4:

## Low level calls:

Use of "call": should be avoided whenever possible. It can lead to unexpected behavior if return value is not handled properly. Please use Direct Calls via specifying the called contract's interface.

more

Pos: 947:27:

## Gas & Economy

#### Gas costs:

Gas requirement of function FatCats.publicBurn is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 955:4:

#### Gas costs:

Gas requirement of function FatCats.setBaseURI is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 960:4:

#### Gas costs:

Gas requirement of function FatCats.requestRandomWords is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

## Miscellaneous

#### Constant/View/Pure functions:

IERC721Receiver.onERC721Received(address,address,uint256,bytes): Potentially should be constant/view/pure but is not. Note: Modifiers are currently not considered by this static analysis.

Pos: 5:4:

#### Constant/View/Pure functions:

FatCats.isApprovedForAll(address,address): Is constant but potentially should not be. Note: Modifiers are currently not considered by this static analysis.

<u>more</u>

Pos: 1017:4:

#### No return:

IERC721A.totalSupply(): Defines a return type but never explicitly returns a value.

Pos: 387:4:

#### Similar variable names:

FatCats.fulfillRandomWords(uint256,uint256[]): Variables have very similar names "s\_randomWords" and "randomWords". Note: Modifiers are currently not considered by this static analysis.

Pos: 1048:25:

#### Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

<u>more</u>

Pos: 937:8:

#### Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

Pos: 997:8:

## Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

## Software analysis result:

These software reported many false positive results and some are informational issues. So, those issues can be safely ignored.
