THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO PUBLIC AFTER ISSUES ARE RESOLVED.

Introduction

EtherAuthority was contracted by the viralataSwap team to perform the Security audit of the viralataSwap protocol smart contracts code. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on August 12th, 2021.

The purpose of this audit was to address the following:

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

Project Background

ViraLata Finance (\$REAU) is an open source, decentralized project, created to help include Brazilians in the cryptocurrency world. REAU provides a safe financial system that is easy to use, and helps make a difference through charitable donations.

Audit scope

Name	Code Review and Security Analysis Report for ViralataSwap Protocol Smart Contracts		
Platform	BSC / Solidity		
File 1	ViralataSwapToken.sol		
Smart Contract Online Code 1	https://github.com/viralatafinance/viralataswap-contracts/blob/master/contracts/auro/ViralataSwapToken.sol		
File 1 MD5 Hash	7E47EDA063062D2AC9404FF7A5786A84		
File 2	AuroDistributor.sol		
Smart Contract Online Code 2	https://github.com/viralatafinance/viralataswap-contracts/blob/master/contracts/farm/AuroDistributor.sol		
File 2 MD5 Hash	9D3825888CA6F3BE27C606B9A033D4E5		
File 3	ViralataERC20.sol		
Smart Contract Online Code 3	https://github.com/viralatafinance/viralataswap-contracts/blob/master/contracts/uniswapv2/ViralataERC20.sol		

File 3 MD5 Hash	010A7C4ECA08ED7C90564BBC87EE7931		
File 4	ViralataFactory.sol		
Smart Contract Online Code 4	https://github.com/viralatafinance/viralataswap-contracts/blob/master/contracts/uniswapv2/ViralataFactory.sol		
File 4 MD5 Hash	163E8A023D032EE63EB68D5DCACB6536		
File 5	ViralataPair.sol		
Smart Contract Online Code 5	https://github.com/viralatafinance/viralataswap-contracts/blob/master/contracts/uniswapv2/ViralataPair.sol		
File 5 MD5 Hash	8B6CD8E61A452B53541F8158CDEAD737		
File 6	ViralataRouter02.sol		
Smart Contract Online Code 6	https://github.com/viralatafinance/viralataswap-contracts/blob/master/contracts/uniswapv2/ViralataRouter02.sol		
File 6 MD5 Hash	99397B16488F8762B365E280CD956488		
Audit Date	August 12th, 2021		
Revision Commit	ad70257437306a7e3d51806d351a254a7f213d25		
Revision Date	August 21st, 2021		

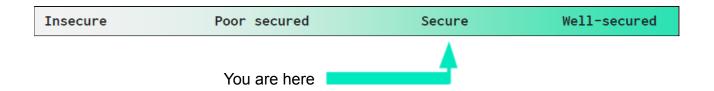

PS: There are 10 external imports from open zeppelin. These files are not included in the audit scope and thus they are not audited.

Claimed Smart Contract Features

Claimed Feature Detail	Our Observation
File 1: ViralataSwapToken.sol Name: ViralataSwap Token Symbol: AURO Maximum Supply is 20 billion tokens. Initial Supply is 200,000 tokens.	YES, This is valid.
File 2: AuroDistributor.sol Max harvest interval: 14 days. Maximum deposit fee rate: 10%	YES, This is valid.
 File 3: ViralataERC20.sol Name: ViralataSwap LP Token Symbol: VLP Decimals: 18 	YES, This is valid.
File 4: ViralataFactory.sol • The ViralataFactory owner can access functions like create Pair, set Migrator, set Fee To Setter, etc.	YES, This is valid.
File 5: ViralataPair.sol Name: ViralataSwap LP Token Symbol: VLP Decimals: 18	YES, This is valid.
File 6: ViralataRouter02.sol • The ViralataRouter02 owner can add Liquidity, remove Liquidity, swap, etc.	YES, This is valid.

Audit Summary

According to the standard audit assessment, Customer's solidity smart contracts are "Secured". These contracts also have owner functions (described in the centralization section below), which does not make everything 100% decentralized. Thus, the owner must execute those smart contract functions as per the business plan.

We used various tools like MythX, Slither and Remix IDE. At the same time this finding is based on critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit overview section. General overview is presented in AS-IS section and all identified issues can be found in the Audit overview section.

We found 0 critical, 0 high, 0 medium and 4 low and some very low level issues. These issues are fixed/acknowledged in the revised smart contract.

Investors Advice: Technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

Technical Quick Stats

Main Category	Subcategory	Result
Contract	Solidity version not specified	Passed
Programming	Solidity version too old	Moderated
	Integer overflow/underflow	Passed
	Function input parameters lack of check	Moderated
	Function input parameters check bypass	Passed
	Function access control lacks management	Passed
	Critical operation lacks event log	Moderated
	Human/contract checks bypass	Passed
	Random number generation/use vulnerability	Passed
	Fallback function misuse	Passed
	Race condition	Passed
	Logical vulnerability	Passed
	Features claimed	Passed
	Other programming issues	
Code	Code Function visibility not explicitly declared	
Specification	Var. storage location not explicitly declared	Passed
	Use keywords/functions to be deprecated	Passed
	Other code specification issues	Moderated
Gas Optimization	"Out of Gas" Issue	Passed
	High consumption 'for/while' loop	Passed
	High consumption 'storage' storage	Passed
	Assert() misuse	Passed
Business Risk	Business Risk The maximum limit for mintage not set	
	"Short Address" Attack	Passed
	"Double Spend" Attack	Passed

Overall Audit Result: PASSED

Code Quality

These audit scope have 6 smart contracts. These smart contracts also contain Libraries,

Smart contracts inherits and Interfaces. These are compact and well written contracts.

The libraries in the ViralataSwap Protocol are part of its logical algorithm. A library is a

different type of smart contract that contains reusable code. Once deployed on the

blockchain (only once), it is assigned a specific address and its properties / methods can

be reused many times by other contracts in the ViralataSwap Protocol.

The team has not provided scenario and unit test scripts, which would have helped to

determine the integrity of the code in an automated way.

Some code parts are not well commented on smart contracts.

Documentation

We were given a ViralataSwap smart contracts code in the form of a github link. The hash

of that code is mentioned above in the table.

As mentioned above, some code parts are **not well** commented. So it is difficult to quickly

understand the programming flow as well as complex code logic. Comments are very

helpful in understanding the overall architecture of the protocol.

Another source of information was its official website https://viralata.finance/ which

provided rich information about the project architecture and tokenomics.

Use of Dependencies

As per our observation, the libraries are used in this smart contract infrastructure that are

based on well known industry standard open source projects. And their core code blocks

are written well.

Apart from libraries, its functions are used in external smart contract calls.

AS-IS overview

ViralataSwapToken.sol

(1) Interface

- (a) IERC20
- (b) IERC20Metadata
- (c) IERC20Permit
- (d) IERC165
- (e) IAccessControl

(2) Inherited contracts

- (a) ERC20Permit
- (b) Pausable
- (c) AccessControl
- (d) ERC20

(3) Usages

- (a) using SafeERC20 for IERC20;
- (b) using SafeMath for uint256;

(4) Events

- (a) event TokensRescued(address indexed sender, address indexed token, uint256 value);
- (b) event MetaTxnsEnabled(address indexed caller);
- (c) event MetaTxnsDisabled(address indexed caller);

(5) Functions

SI.	Functions	Type	Observation	Conclusion
1	isTrustedForwarder	read	Passed	No Issue

Severity Definitions

Risk Level	Description
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc.
High	High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial
Medium	Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose
Low	Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution
Lowest / Code Style / Best Practice	Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored.

Audit Findings

ViralataSwapToken.sol

Critical

No Critical severity vulnerabilities were found.

High

No High severity vulnerabilities were found.

Medium

No Medium severity vulnerabilities were found.

Low

(1) Missing zero address validation:

```
constructor(address trustedForwarder) ERC20("ViralataSwap Token", "AURO")
ERC20Permit("ViralataSwap Token") {
    _setupRole(DEFAULT_ADMIN_ROLE, _msgSender());
    _setupRole(PAUSER_ROLE, _msgSender());
    _setupRole(MINTER_ROLE, _msgSender());
    _setupRole(RESCUER_ROLE, _msgSender());
    _trustedForwarder = trustedForwarder;
    _mint(_msgSender(), _initialSupply);
}
```

Detects missing zero address validation.

Resolution: Line no: 36 Check that the address is not zero.

Status: acknowledged

Very Low / Discussion / Best practices:

(1) Use latest solidity version:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.2;
```

Using the latest solidity will prevent any compiler level bugs.

Resolution: Please use 0.8.7 which is the latest version.

Status: acknowledged

(2) Function input parameters lack of check:

Variable validation is not performed in below functions : mint = amount | rescueTokens = value & address validation missing In isTrustedForwarder function.

Resolution: There should be some validations to check the variable is not empty or greater than 0 and address validation.

(3) Make variables constant:

```
uint256 private _maxSupply = 2000000000 * 10**decimals();
// 2 billion tokens is maximum supply
uint256 private _initialSupply = 200000 * 10**decimals();
// 200,000 tokens is the initial supply
```

._maxSupply, _initialSupply. These variables will not be changed. So, please make it constant. It will save some gas.

Resolution: Declare those variables as constant.

Status: acknowledged

AuroDistributor.sol

Critical

No Critical severity vulnerabilities were found.

High

No High severity vulnerabilities were found.

Medium

No Medium severity vulnerabilities were found.

Low

(1) Hardcoded address used:

```
// remember to change for mainnet deploy
address constant _trustedForwarder = 0xEa9983bBb6FD1f95cd0A40275c6aC51B56Ae6176;
```

If the private key of the hard coded address is compromised, then it may create problems.

Resolution: Line no : 14 don't use hard coded addresses or make sure to handle the private key of it very securely.

(2) Infinite loop possibility:

```
// Set farming start, can call only once
function startFarming() public onlyOwner {
    require(block.number < startBlock, "Error::Farm started already");

    uint256 length = poolInfo.length;
    for (uint256 pid = 0; pid < length; ++pid) {
        PoolInfo storage pool = poolInfo[pid];
        pool.lastRewardBlock = block.number;
    }

    startBlock = block.number;
}</pre>
```

```
// Update reward vairables for all pools. Be careful of gas spending!
function massUpdatePools() public {
    uint256 length = poolInfo.length;
    for (uint256 pid = 0; pid < length; ++pid) {
        updatePool(pid);
    }
}</pre>
```

If there are so many Pools, then this logic will fail, as it might hit the block's gas limit. If there are very limited pools, then this will work, but will cost more gas.

Resolution: Line no: 153, Line no: 230.

(3) Missing zero address validation:

```
constructor(
    IAuroERC20 _auro,
    uint256 _auroPerBlock
) {
    //StartBlock always many years later from contract construct, will be
    //set later in StartFarming function
    startBlock = block.number + (10 * 365 * 24 * 60 * 60);

    auro = _auro;
    auroPerBlock = _auroPerBlock;

    devAddress = msg.sender;
    feeAddress = msg.sender;
    _operator = msg.sender;
    emit OperatorTransferred(address(0), _operator);
}
```

Detects missing zero address validation.

Resolution: Line no: 98 Check that the address is not zero.

Status: acknowledged

Very Low / Discussion / Best practices:

(1) Use latest solidity version:

```
// SPDX-License-Identifier: MIT
pragma solidity ^0.8.2;
```

Using the latest solidity will prevent any compiler level bugs.

Resolution: Please use 0.8.6 which is the latest version.

Status: acknowledged

(2) Function input parameters lack of check:

Variable validation is not performed in below function :

getMultiplier -- from , to.

Resolution: There should be some validations to check the variable is not empty or greater than 0 and address validation.

(3) Critical operation lacks event log:

Emit/ Event log is not written for add, set, updatePool, massUpdatePools.

Resolution: Please add emit for all listed functions.

Status: acknowledged

(4) External instead of public:

If any function is not called from inside the smart contract, then it is better to declare it as external instead of public. As it saves some gas as well.

https://ethereum.stackexchange.com/questions/19380/external-vs-public-best-practices

Status: acknowledged

ViralataERC20.sol

Critical

No Critical severity vulnerabilities were found.

High

No High severity vulnerabilities were found.

Medium

No Medium severity vulnerabilities were found.

Low

No Low severity vulnerabilities were found.

Very Low / Informational / Best practices

(1) Unused functions

```
function _mint(address to, uint value) internal {
   totalSupply = totalSupply.add(value);
   balanceOf[to] = balanceOf[to].add(value);
   emit Transfer(address(0), to, value);
}

function _burn(address from, uint value) internal {
   balanceOf[from] = balanceOf[from].sub(value);
   totalSupply = totalSupply.sub(value);
   emit Transfer(from, address(0), value);
}
```

The functions _mint and _burn are not called from any other functions. And they are internal functions, so they can not be called from outside.

Resolution: We suggest implementing the logic which uses them. And if not needed, then they can be removed to make the code clean.

Status: acknowledged

ViralataFactory.sol, ViralataPair.sol, ViralataRouter02.sol

No Critical, High, Low severity vulnerabilities were found.

Centralization

These smart contracts have some functions which can be executed by Admin (Owner) only. If the admin wallet private key would be compromised, then it would create trouble. Following are Admin functions:

- startFarming: The AuroDistributor Owner can Set farming start, can call only once.
- add: The AuroDistributor Owner can add multiple pools with the same Ip token without messing up rewards, because each pool's balance is tracked using its own totalLp.
- set: The AuroDistributor Owner can update the given poole's AURO allocation point and deposit fee.
- pause and unpause: The ViralataSwapToken Pauser wallet can pause and unpause the token transfer
- mint: The ViralataSwapToken Minter wallet can mint new tokens capped at max supply.
- rescueTokens: The ViralataSwapToken Rescuer wallet can take any tokens from its own smart contract to another wallet.
- setFeeTo and setMigrator in ViralataFactory contract can be set by the feeTo wallet.
- setFeeToSetter, setAuroAddress, enableMetaTxnsPair and disableMetaTxnsPair in ViralataFactory contract can be set by the feeToSetter wallet.

Conclusion

We were given a contract code. And we have used all possible tests based on given

objects as files. We observed some issues, but they are not critical. So, it's good to go to

production.

Since possible test cases can be unlimited for such smart contracts protocol, we provide

no such guarantee of future outcomes. We have used all the latest static tools and manual

observations to cover maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static

analysis tools. Smart Contract's high level description of functionality was presented in

As-is overview section of the report.

Audit report contains all found security vulnerabilities and other issues in the reviewed

code.

Security state of the reviewed contract, based on standard audit procedure scope, is

"Secured".

Our Methodology

We like to work with a transparent process and make our reviews a collaborative effort.

The goals of our security audits are to improve the quality of systems we review and aim

for sufficient remediation to help protect users. The following is the methodology we use in

our security audit process.

Manual Code Review:

In manually reviewing all of the code, we look for any potential issues with code logic, error

handling, protocol and header parsing, cryptographic errors, and random number

generators. We also watch for areas where more defensive programming could reduce the

risk of future mistakes and speed up future audits. Although our primary focus is on the

in-scope code, we examine dependency code and behavior when it is relevant to a

particular line of investigation.

Vulnerability Analysis:

Our audit techniques included manual code analysis, user interface interaction, and

whitebox penetration testing. We look at the project's web site to get a high level

understanding of what functionality the software under review provides. We then meet with

the developers to gain an appreciation of their vision of the software. We install and use

the relevant software, exploring the user interactions and roles. While we do this, we

brainstorm threat models and attack surfaces. We read design documentation, review

other audit results, search for similar projects, examine source code dependencies, skim

open issue tickets, and generally investigate details other than the implementation.

Documenting Results:

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this we analyze the feasibility of an attack in a live system.

Suggested Solutions:

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

Disclaimers

EtherAuthority.io Disclaimer

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

Due to the fact that the total number of test cases are unlimited, the audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

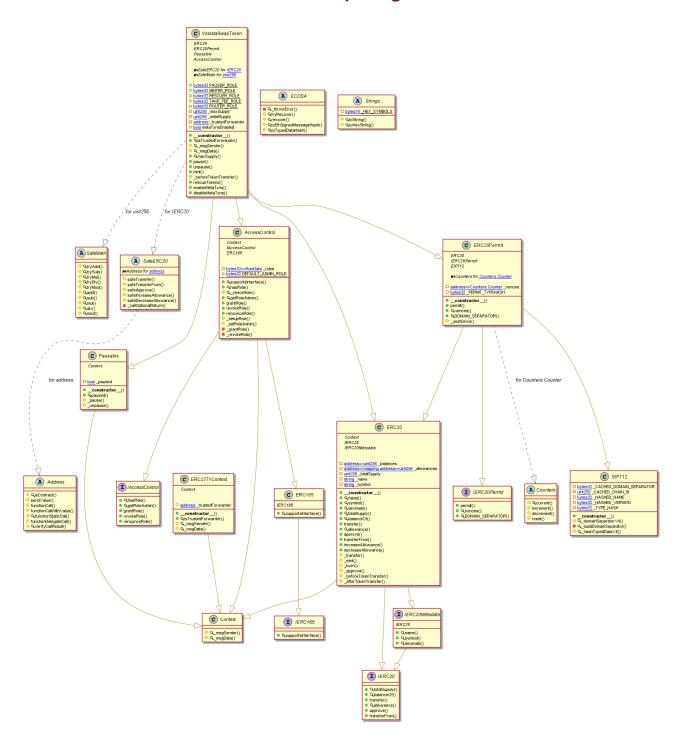

Technical Disclaimer

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee explicit security of the audited smart contracts.
